1. TRANSPORT & STORAGE

In general the rolls and boxes must be stored in a sheltered clean and dry indoor place and free from any pollution. Before installation, the rolls with 2ml width should be stored upright and safely secured; other dimension above 2ml should be stored horizontally. Tiles should be stored flat in their packages, in small neat piles (not more than 5 boxes high in the locality prior to installation). They should also be protected from extreme temperature (heat and cold), moist, rust, rot, free from any contamination and not piled-up nor crushed under heavy weight. State of the art handling must be respected.

Rolls and tiles must be stored during 48 hours before starting the operation. For installation, room temperature should always be above 15°C or 18°C for linoleum. Check the rules in your country; those temperatures could be different.

Before installation, sheets and tiles should relax minimum 24h, out of packaging.

2. HANDLING

For the best results, follow the installation instructions below, and use the tools and the accessories recommended by the manufacturer. Care should be taken when handling all types of floorcoverings to ensure that safety procedures are followed and damage does not occur to the material or people.

Check the material for visible defects and/or damage before and during installation and report to Tarkett representative.

For each continuous surface use the same batch number and install rolls/boxes in sequential order.

Wrong transport, storage and/or handling could damage the flooring, causing aesthetical or technical issues. Tarkett does not warrant or guarantee flooring problems caused by inappropriate storage or handling.
3. SUBFLOOR CONTROL

The subfloor quality is the 1st condition for a successful installation, so make sure it is in good condition to do a flooring installation.

Always bear in mind that in most countries, the installer is responsible for the acceptance of the subfloor on which he will do the installation. He will then be held responsible for any potential claim/litigation.

The subfloor must be flat, clean, free from all debris & residues, without any marks (no felt pen, marker of any type, ballpoint pens, paint, etc. that could cause discolouration due to migration) sound, dry, solid, hard, smooth.

The absorbency must be checked and subfloor should not be exposed to humidity. The preparation/dryness of the subfloor and installation procedures should all be as per the current relevant Standard within the country of use.

The dryness of a solid subfloor should be below the maximum moisture level permitted when tested in accordance with the said Standard. Check the rules in your country to define the appropriate method and values.

For marking, only use a non-oily graphite pencil.

3.1 SUBFLOOR CHARACTERISTICS

- **Humidity rate**
  Always refer to each country regulations. For info, the drying time of a concrete floor is approx 2 weeks per cm. For testing, refer to the regulations valid in your country (Relative Humidity test, Calcium carbide system...).

- **Absorbency – Porosity**
  Check local regulations, but in general a subfloor is said too absorbent when the absorbency time of a drop of water on concrete is less than one minute. In this case, a primer must be used before leveling compound, with a 1/1 dilution.

  A subfloor is said non-absorbent when the absorbency time of a drop of water on concrete is more than 10/15 minutes. In this case, the primer should be used non-diluted.

  Prior to the use of a primer, always follow manufacturer’s instructions.

- **Planarity / Flatness**
  Different ways for measuring acc. countries.
  - France: tolerance must be less than 7mm over 2m for concrete subfloor and 5mm for wood subfloor.
  - UK/Nordic: 3mm over 2m (& depending on localities, SR1 or 2...).
  - Germany: 4mm over 2m (Din 18202).
  - NL/Australia: 2mm over 2m.
  - Tolerance must be less than 2mm over 20 cm of concrete/wood subfloor.

  Excessive humidity rate can cause disbonding, bubbles, colour migration that Tarkett does not warrant or guarantee.

  Non-absorbent subfloor could lead to a longer waiting time of the adhesive generating trouble in the bond plane. Too absorbent subfloor could lead to a shorter waiting time of the adhesive that could cause disbonding issue.

  Non-flat surface could lead to visual issues or generate additional cost for the installer when using more levelling compound to recover the surface flatness.
3. SUBFLOOR CONTROL

- **Cracks & joints**
  First step will be to identify the type of crack or joint that will be discovered on the building site to adapt the treatment.

- **Cracks**
  Cracks (0.3 to 1mm large) can appear during the drying of the concrete by contraction.

- **Expansion joints**
  Expansion joints are used to compensate dimensional variations and building movements.

- **Contraction (dividing) joints**
  Contraction joints allow free contraction of concrete and avoid cracks during drying.

- **Isolating joints**
  Isolating joints separate the screed from other independent building constructions (walls, pillar).

- **Micro-cracks**
  Cracks almost not visible (≤ 0.3 mm large).

- **Construction joints**
  Construction joints are used to stop daily pouring of concrete slab.

- **Hardness**
  The subfloor has to be resistant enough to compression and indentation.
  To measure the hardness of the concrete, installer can use a sclerometer.
  Isolating joints separate the screed from other independent building constructions (walls, pillar).

- **Sound**
  The subfloor has to be free from contaminants such as hydrocarbon stains, paints, chemical residues or laitance on the surface.
  Any contaminant left on the subfloor could cause colour migration and product damage.

- **Clean**
  The subfloor has to be free from any particles, dust, traces of felt pen or marker.
  Particles, scratches and residues could cause visual defect (telegraphing effect).

**Micro-cracks should be treated with a primer.**

Cracks and construction joints should be sawed, cleaned and full filled with an epoxy resin on which sand will be spread.

Contraction joints should be full filled with an epoxy resin on which sand will be spread.

Expansion joint will be treated with a profile inserted or overlapped. Levelling compound and floorcovering will be stopped on both sides.

Isolating joints will be filled with soft material (e.g. polystyrene).
### 3. SUBFLOOR CONTROL

#### 3.2 SUBFLOOR TYPES - PREPARATION

<table>
<thead>
<tr>
<th>Type</th>
<th>Preparation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>New subfloor</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Concrete/cement base</strong></td>
<td><strong>Preparation:</strong> water base primer compound + self levelling compound adapted to the traffic level.</td>
</tr>
</tbody>
</table>
| **Wood or wood particles/plywood base** | **Preparation:** wood adapted primer compound recommended, direct installation possible or add a special wood fiber levelling compound. For wood base, you should check:  
  - flexibility (thickness - length)  
  - fixing – cupping (opening)  
  - glued grooves and tongues  
  - caulking of joints (wood paste)  
  - sanding (smoothing). |
| **Bitumen base** | **Preparation:** neoprene vinyl emulsified primer or bitumen adapted primary + bitumen adapted self levelling compound. |
| **Anhydrite base (humidity rate < 0.5% CM)** | **Preparation:** sanding of the surface then apply an adapted primer or emulsion, in principle, screeding is not necessary. |
| **Metal** | **Preparation:** apply an anti-rust primer + gluing, after thorough cleaning of any oily residue. |

<table>
<thead>
<tr>
<th>Type</th>
<th>Preparation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Old subfloor (renovation)</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Terrazzo or ceramic tiles</strong></td>
<td><strong>Preparation:</strong> 1° make sure that all tiles are still well bonded to subfloor. Removal of surface coating or sealer - Apply an emulsified primer + adapted self levelling compound.</td>
</tr>
</tbody>
</table>
| **Wood parquet (glued, not floating)** | **Preparation:** 1° check that all wood planks and pieces are well in place, solid and securely fixed, then apply a primer or adapted emulsion + fibre reinforced self levelling compound specific for wood.  
  **NOT recommended for HOMOGENEOUS Vinyl Products.** |
| **Old floorcovering** |  |
| **Textile** | **Preparation:** must be fully removed, scraped, and then apply a self levelling compound adapted to the area. |
| **Vinyl** | **Preparation:** we recommend removing all old floorings (for security, fire regulations, migration prevention etc...), scraping and applying an emulsified primer + self levelling compound adapted to the area.  
  It may exceptionally be possible to install over old HO compact Vinyl floorings or even VCT type which are in good conditions & well bonded to the subfloor, and mainly applicable for small areas.  
  Two possibilities: thorough cleaning and degreasing of the surface & either install directly after application of an acrylic base adhesive adapted for PVC on PVC installation. Or, application of cement base levelling compound, according to manufacturer’s recommendations.  
  **If installing over old floorcovering, specific safety regulations have to be strictly followed. Please check with all local regulations. For heavy duty usage, old floorings must be removed.** |
| **Underfloor heating** | **Stop heating at least 48h before screeding and/or floorcovering installation.**  
  **Re-start heating progressively 48h after installation (few degrees per day).**  
  **In case of underfloor heating, we recommend that the vinyl tiles are hot welded.**  
  **The temperature should never exceed the floorcovering industry agreed maximum of 27°C. Ensure that the room temperature will remain at minimum 18°C for installation.** |
3.3 MATERIALS FOR INSTALLATION

■ Primer

Different types: solvent/water based, PU, Epoxy.

Main actions:
- grade the site & the over-absorbent and/or different subfloor surfaces.
- grade the permeability of subfloor where drying time could be too quick
- improve the bonding performance of the leveling compound on non-porous subfloor.

Application:
in general, the primer is applied with a brush/roller. Consumption depends on the planarity of the subfloor: 80 – 120 g/m².

Strictly follow manufacturer’s instruction.

■ Self-levelling compound

Definition:
Is a smoothing cement based compound finish for indoor use that will be covered by a floorcovering.

Main actions:
- rectify the subfloor porosity = possibility to glue without any particular preparation
- self levelling action resulting in homogeneous & smooth surface

■ Adhesive

Although Tarkett may recommend a selection of manufacturer adhesive, we do not however guarantee the products listed. The list of products and manufacturers are not guaranteed complete or current.

Tarkett would not accept any liability for any of these products failing to perform in conjunction with any of their products.

It is the responsibility of the adhesive manufacturer and flooring contractor to ensure the products being used are appropriate for use and applied in accordance with the manufacturer recommendations.

For best selection, always check:
- Compatibility with the flooring product backing (PVC, PU, jute…)
- Aspect of the backing: rough, smooth, fibers, grid...
- Flooring porosity (textile, jute....)
- Subfloor porosity (absorbent or not)
- Quality/Performance (polyvalence, consumption...).

Consider flooring nature, subfloor type and conditions of use to determine the adhesive type and the spatula. According manufacturer’s instructions and building site conditions, determine the drying and working time.

In general:
- Moderately absorbent subfloor: use finely notched trowel (approx. 250g/m² to 300g/m²).
  - For compact products (smooth backink):
    - use A1 spatula (TKB model).
  - For acoustic products (honey comb foam):
    - use A2 spatula (TKB model).
- Non absorbent subfloor: use very finely notched trowel (approx. 150g/m² to 200g/m²).
  - May be the case for wall, Tarkolay, etc:
    - use A4 spatula (TKB model).

For Linoleum use a notched trowel, type will depend on the backing (approx. 300g/m² to 350g/m² for jute backing, 200g/m² to 300g/m² for foam backing).
- For compact products (jute backing):
  - use B1 spatula (TKB model).
- For acoustic products (foam backing):
  - use A2 spatula (TKB model).

For more details on adhesives, please refer to the specific Tarkett Adhesive recommendation list.

Applying a leveling compound without using first a primer could cause delamination or cracks of the levelling compound.

Before laying down the floorcovering, in case application require a drying time of the adhesive, always check that water or solvents are evaporated (finger test - no transfer).

Other application may require wet bonding (see Manufacturer instruction) like for linoleum or LVT.

Heavy roller must be used to ensure bonding.

For Linoleum use a notched trowel, type will depend on the backing (approx. 300g/m² to 350g/m² for jute backing, 200g/m² to 300g/m² for foam backing).
- For compact products (jute backing):
  - use B1 spatula (TKB model).
- For acoustic products (foam backing):
  - use A2 spatula (TKB model).
4. INSTALLATION

Please refer to each individual installation notice per product range, adhesive chart with Tarkett selection as guide line.

4.1 GENERAL RULES

- Laying - Sheets

1. **Room dimensions**
   
   If the room is reasonably square, the sheets should run parallel to the incoming light. In long, narrow rooms it is best to install the sheets along the length of the room.

2. **Layout nok**
   
   Joint placed at a door step.

3. **Layout nok**
   
   Loosing material.

4. **Layout ok**

5. **Reference line**
   
   Align the sheet edge to the reference line.

6. **Sheets preparation (cutting and relaxation)**
   
   Sections of flooring must be cut to the required lengths, plus an allowance of a few centimeters.
4. INSTALLATION

Please refer to each individual installation notice per product range, adhesive chart with Tarkett selection as guide line.

**Laying - Sheets**

*7* **Half folding or rolling**

Can be rolled or fold.

*8* **Gluing**

Spread the adhesive with the appropriate spatula.

*7* **First sheet folding back into the adhesive and pressing**

It’s important to use the cork press when you gradually roll out the sheets onto the adhesive. In this way, you will avoid catching air under the sheets that may cause blisters later on.

Pay attention to spread adhesive till the line. For the second half, ensure not to let space without adhesive or to overglue.
4. INSTALLATION

Please refer to each individual installation notice per product range, adhesive chart with Tarkett selection as guide line.

### Laying - Sheets

10  **Next sheets folding back and pressing**

11  **Repeat for the second half**

12  **Gluing**

13  **First sheet folding back into the adhesive and pressing**

It's important to use the cork press when you gradually roll out the sheets onto the adhesive. In this way, you will avoid catching air under the sheets that may cause blisters later on.
4. INSTALLATION

Please refer to each individual installation notice per product range, adhesive chart with Tarkett selection as guide line.

## Laying - Sheets

### 14 Next sheets folding back
Repeat the same operation with the second half of sheets.

### 15 Final pressing
When gluing and pressing is done, excess of material close to walls and obstacles can be trimmed/flushed (freehand cut).

### 16 Hot or cold welding
And then, use the heavy roller (mini 50kg) to ensure the final bonding.

Tools for freehand trimming:
- **Knife:**
- **Hook and concave blades:**

More detail page 14 & 15

**Specific case of Linoleum:**
Due to jute backing, linoleum will require wet bonding installation and due to its construction, installer will have to use scribing tools to trim edges and joints. For more details, please refer to the specific Linoleum installation instruction.
4. INSTALLATION

4.1 GENERAL RULES

- Laying - Tiles

1  Room dimensions

2  Layout

3  Reference axes

4  Starting lines definition

5  Reference line

6  Gluing

When needed (cut-off too short), shift the reference line.

Please refer to each individual installation notice per product range, adhesive chart with Tarkett selection as guide line.
4. INSTALLATION

Please refer to each individual installation notice per product range, adhesive chart with Tarkett selection as guide line.

- **Laying - Tiles**

  7. **Placement**

     ![Image of placement diagram]

  8. **Scribing**

     ![Image of scribing diagram]

- **Scribing**

   ![Images of scribing steps]
4. INSTALLATION

Please refer to each individual installation notice per product range, adhesive chart with Tarkett selection as guide line.

- **Laying - Tiles / Diagonal installation**

  - **Scribing**

  - **Continue with the other quarters**

  - **Pressing of the whole installation**

  Repeat the same operation with the second half of sheets. And then, use the heavy roller (mini 50kg) to ensure the final bonding.
4. INSTALLATION

Please refer to each individual installation notice per product range, adhesive chart with Tarkett selection as guide line.

**Joints welding**
According to the product installed and the classification of the room, you could either hot weld (all types of flooring) or cold weld the joints (PVC HE only). Joints treatment depends on room classification; please refer to your country regulation to determine which type is accepted/required.

**Hot welding (min. 24h after installation):**

- [Grooving](image)
- [Welding](image)
- [Trimming (x2)](image)
- [Quarter moon knife](image)
- [Mozart](image)

**Recap table of welding parameters**

<table>

**Results of welding after trinning**

- [Hot air welding gun + Nozzle](image)

**Always adapt the t°C speed & pression to the situation.**
4. INSTALLATION

Please refer to each individual installation notice per product range, adhesive chart with Tarkett selection as guide line.

**Cold welding (min. 24h after installation):**

- Overlap flooring and cut both layers.
- Realization 24 hours after installation.
- Overlap the 2 sheets till the potential pattern match is achieved.
- The overlapping will be double cut in one step or 2 in case of thick flooring alongside a metal ruler.

Result should be an extremely tight joint.

- Fix a special masking tape, centred over the cut seam, then cut the masking tape with the rolling knife within the seam.
- Apply the cold welding liquid by pressing the needle deeply into the seam.

Important: ensure you apply enough liquid along the entire joint.

- After 10 minutes the cold-welding liquid on the masking tape should be dry and the tape is removed carefully backwards.
- The seam can be walked on after 24h.

**4.2 SPECIFIC PRODUCTS**

For the following products: Linoleum, conductive floorcovering, stairs, wet room concept, please refer to specific installation instructions.

**4.3 COVE FORMING**

In particular cases (wet room concept, hospital...), cove forming could be mandatory.

- With a cove former

**4.4 ACCESSORIES**

Many accessories are available to complete the installation: stairs profiles and borders, warning strips and signage, wall profiles, skirting...
5. INSPECTION (acc. to DTU 53.2 P1-1)

- Clean working area from all adhesive marks, stains and dust.
- Prevent soiling by protecting the area.
- Open the area to normal traffic 48 hours after installation and move furnitures after 72 hours.
